(54) Image processing apparatus.

⑤7 An ODD/EVEN signal, showing whether odd fields or even fields of the image are displayed on a screen, is supplied to each unit operating for data transmission. In accordance with the ODD/EVEN signal, a CPU monitors a current condition of the display image so that data transmission and process-

ing, and use of a data bus, are controlled with exact timing. Consequently, each unit in the apparatus may operate effectively.

The CPU detects linewise whether the current period is a display period or a fly-back period, and a number of raster being displayed.
